

Installation and configuration of the FortiClient to connect to the DRFZ after the introduction of EMS

1. **Download and installation** – The latest version 7.0.8 of the FortiClient can also be used under macOS Monterey (version 12.x.x), macOS Ventura (version 13.x.x) and macOS Sonoma (version 14.x.x). This is provided by IT under the following link:

<https://VPN-EMS.drfz.de:10443/installers/Default/Client-7.0.11>

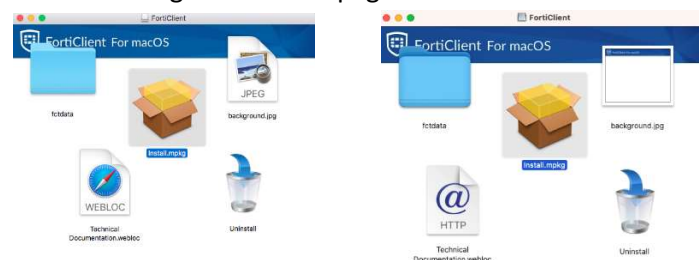

2. **Download and execution of the installer** – After the download is complete, the installer (*.dmg file) is listed in the download and can be opened or mounted there with a double-click.

3. **Mounting** – The mounted installer appears on the desktop and can be opened with a double click.

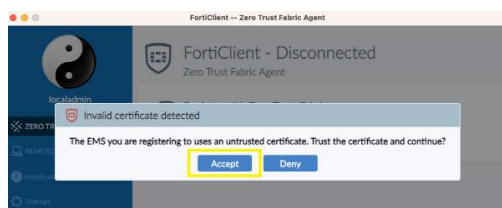

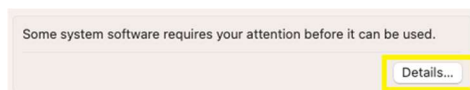

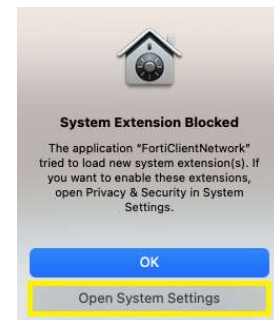

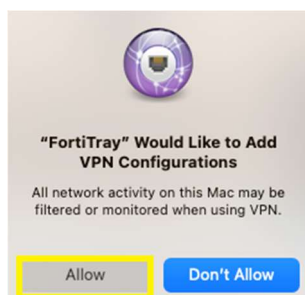

4. **Installation** – Double-clicking on 'Install.mpkg' now starts the actual installation process.

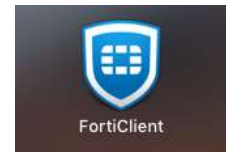

5. **Installation process** – The installation process has now started and you will be guided through it in a dialog; it may be necessary to grant some permissions.

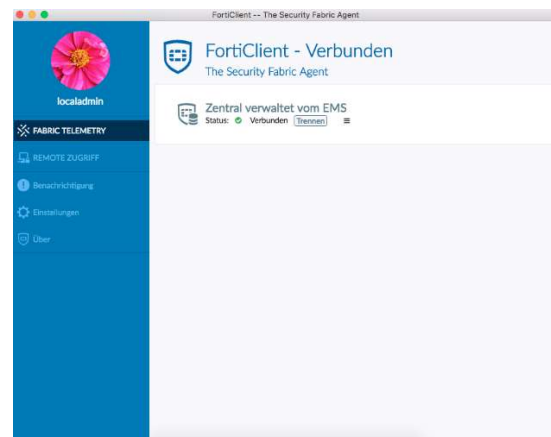

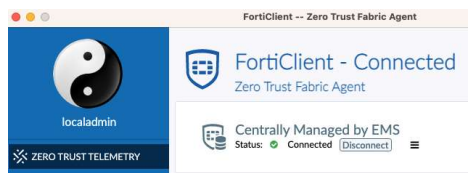

6. **Permissions** – Some of the permissions shown below may be required during installation.

7. **Completion of the installation** – After successfully completing the installation, the FortiClient will be listed in the launchpad and menu bar.

8. **Program start and configuration** – When starting the FortiClient (starts automatically after installation), it should be preconfigured and establish a connection with the appropriate server (vpn-ems.drfz.de).

A VPN connection can now be established as usual under remote access.
